Coastal Barriers at Risk

Puerto Rico Sea Grant research highlights ocean acidification hotspots

"Our studies help us identify the geographic distribution of surface carbonate chemistry, which is important in the identification of ocean acidification hotspots for vulnerable organisms."- Melissa Meléndez Oyola, Ph.D. Student, University of New Hampshire

Coastal Barriers at Risk

Beneath the waves just outside the serene fishing village of La Parguera, Puerto Rico, danger is lurking. The village's natural protectors against incoming waves, coral reefs, are facing an invisible threat: ocean acidification. With funding from [Puerto Rico Sea Grant](#) in 2017, researchers from University of Puerto Rico, University of New Hampshire and the Caribbean Regional Association for Coastal Ocean Observing are working together to develop the first biogeochemical and physical assessment for the La Parguera barrier system. The results are enabling detection of hotspots of coastal ocean acidification in coral reef ecosystems and highlighting areas that may be vulnerable to dissolution.
